

In-Sider

Wi-Fi-Network-UHF Radio

In-Sider provides superior communications inside buildings AND connects to others OUTSIDE buildings!

When you need to talk.....

inside big buildings, with no FCC license, or repeater, you need our new *In-Sider* Wi-Fi Network radio! The *In-Sider* provides rock solid coverage in any large building equipped with Wi-Fi, and it can directly connect to participating first responder agencies participating in the *CareNet Program* (More about that shortly).

The Nextel i680 *In-Sider* uses existing WiFi for superior in-building coverage, plus connectivity to outside Network Radios. The price is right – just \$449 plus \$9.90 monthly or \$99.00 annually for server connection.

Better yet, the *In-sider* can communicate directly with analog UHF radios commonly used by churches, fire departments, hospitals, industrial plants, and schools. Not only can the *In-Sider* talk to PC's equipped with our Real-PTT software but to i500 i680 and radios used by law enforcement and other participants in the *CareNet Program* (See info4u.us/CareNet-2018.pdf) and the popular m370 school bus radios as well. And, the *In-Sider* is fully compatible with the PocketMate school classroom radio (See info4u.us/PocketMate.pdf) and the *CurbSider* system for schools (See info4u.us/CurbSider.pdf).

The *In-Sider* radio requires very little transmitter power which means that charging intervals are measured not in terms of hours, but DAYS!. With the *In-Sider* you can have multiple talk groups (Administration, Security, Maintenance, Housekeeping, etc.) that can be talking simultaneously without interfering with each other, yet be able to come together as a master group when required.

Speaking of “coming together”, *In-Sider* radios have single button emergency calling that can send a call for assistance at the push of a button! The incredible thing is that the call can be sent to a desktop interconnected PC, on or off site. We'll tell you more about this feature on the following page.

License free Network communications for large buildings!

**Guess what happens,
when you push that
little button?**

Here's the rest of the story!

On the previous page, you learned more about the radio that is ideally suited for large buildings. It can also talk to PC's and that's another major benefit of the FCC license free technology. That is what gives us the ability to use this fantastic new radio as a part of an integrated community safety plan known as the CareNet-2018 Program. Here's how it works. People in peril are under constant threat by "Disruptive People" and/or Catastrophic Events such as fires or medical emergencies in churches, day care centers, manufacturing plants, medical clinics, retirement homes, schools, and anyone handling cash or dealing with the public.

With over a decade of experience of improving community safety in courtrooms, industrial plants, municipal facilities, and schools, we have been able to significantly reduce response time with a system known as *AlarmAlert* (See info4u.us/BillKnows for additional information). Unfortunately, the *AlarmAlert* system is cost effective only for four or more users at the same location and it is primarily designed for direct notification to law enforcement.

A solution was needed where only ONE calling device was needed, better yet, with the ability to call participating law enforcement agencies, either municipal county or both. Ideally, the ability to call participating private ambulance services, fire and rescue departments AND law enforcement would be a plus. There is such a device. It's called the *In-Sider!* The cost per user is only \$548 for the first year (that's less than a dollar per day) and \$9.90 monthly or \$99 annually thereafter for dedicated Internet server fees. That's a small price to pay for help in a hurry when needed.

Ideally, local law enforcement, ambulances, and fire departments will participate through an agreement known as *The CareNet Program*. For more information, see info4u.us/CareNet-2018.pdf. All they need is an Internet connected PC. No additional equipment is required, only an annual payment of \$99 for Internet server fees. If the agency is using *TeamTalker* network radios (See info4u.us/TeamTalkers for more info), there is NO additional charge to receive emergency call notifications. This is a WIN-WIN opportunity for all concerned.

We have a short little video that demonstrates what happens when a user presses the *In-Sider* emergency call button. Just scan the QR Code image on the right with your smart phone. As you will see, within SECONDS, an emergency message appears on the PC screen of a participating agency with the name of the user and a map, displaying a choice of street or satellite view. Pretty impressive!
