# AN INTRODUCTION TO AUDIO ACCESSORY EARSETS

## Stick it in your ear.....

or around your ear, or near your ear for better, more personal communications with your *PocketMate*, or *PD362* 2-way radios from Falcon Wireless! Our selected covert communications accessories shown below are especially well suited for a variety of institutional communications needs. The charts below will show you how it all works. It all starts with choosing whether you want receive only privacy (See diagram below on the left), or whether you also want to discreetly control the transmit function of the associated radio.

**\$19.95**

The device at the left is an economy Receive only device consisting of an ear bud (See bottom right below, a standard 20" black resin cable and single pin cable priced at \$19.95. The device at the right is for use in high noise level zones where the user also needs to be able to hear nearby sounds (This is known as "Situational Awareness" capability). Very nice (and expensive) product using a Hi-Def Ear Tip. The price is \$39.95.

**\$39.95**

**\$29.95**

Available at slight additional cost is a combination covert receive and transmit model with an in-line microphone and PTT (as shown at left with a swivel ear hook and straight resin cord with radio connector). Optional ear devices are shown below. The price for the "straight wire" model is \$29.95. Upgrade costs for optional ear sets are shown below. An Acoustic tube upgrade adds \$15.00.

**\$19.95**

**CHook**

**Ear Bud**

**Adds \$15.00**

**Adds \$10.00**

**Adds \$15.00**

**Adds \$10.00**

**No extra charge**

So far, we have discussed the things that go in, on, or around your ear and the option to use them only for audio privacy or as a covert communications controller by adding remote Push-To-Talk (PTT). There is another element to covert communications – the cord that connects the radio to the personal audio ear set and/or remote Earset/PTT/Microphone. The "cord" comes in three different types – the standard black resin being the most common, the clear acoustic type favored by security professionals (See chart above – top middle), and a new ruggedized braided fiber that offers the additional benefit of noise reduction (as applicable to interference issues). Our prices assume a resin cable. An upgrade to Acoustic Tube or Braided fiber adds \$15.00 for either type.
